Enterprise Data, Analytics & Integration Transformation

Enterprise Capability Case Study

Scaling analytics adoption through enterprise data platform alignment

I lead enterprise data transformation aligning platform integration, KPI logic, and stakeholder ownership to deliver decision-grade analytics and reporting solutions.

Emilio Apestegui

Enterprise Analytics Cannot Scale Due To Fragmented Data Ownership

BUSINESS PROBLEM

The organization cannot scale analytics adoption because ownership, data logic, and platform execution are fragmented across functions.

Revenue Differs by Function

Finance	$126.8M
Merchandising	$131.1M
Supply Chain	$122.9M

$8.2M variance due to inconsistent ownership, timing, and definitions

Additional Issues

- Inventory valuation conflicts
- Margin calculation differences
- Integration dependencies impacting reporting

Executive Impact

- Decisions delayed
- Reporting confidence reduced
- Manual reconciliation required

> The problem is not data quality. The problem is enterprise operating model fragmentation.

Emilio Apestegui

Enterprise Solution: KPI Industrialization Platform Transformation

IMPLEMENTED

Built enterprise KPI platform aligning: Data logic, Ownership, Integration reliability, Quality controls, and Executive consumption.

Before

- Multiple KPI versions
- Manual reconciliation
- Unclear ownership

After

- Single KPI model
- Automated controls
- Defined ownership

Reduced Reporting Friction

Faster Decision Cycles

Increased Analytics Adoption

> Enterprise KPIs must be engineered as data products, not reports.

Emilio Apestegui

Stakeholder Alignment Model

ISSUE SCOPE

Enterprise stakeholder dynamics managed across four key groups:

Technology

Needs platform stability

Finance

Needs reporting accuracy

Operations

Needs data speed

Executives

Need trusted decisions

Leadership Approach

Aligned incentives across groups by:

- Defining KPI ownership
- Standardizing definitions
- Creating integration accountability
- Establishing escalation paths

> Enterprise data transformation is a stakeholder alignment problem before it is a technology problem.

Emilio Apestegui

Integration & Platform Execution Model

Root Causes Identified

- Vendor integration failures
- Batch scheduling conflicts
- Feed contract inconsistencies

Platform Risks Surfaced

- 1 integration incident
- 2 degraded feeds
- Regional dependency gap

Business Impact

Platform reliability directly impacts analytics reliability.

This aligns directly to Data & Integration.

> Analytics trust is determined upstream by integration execution.

Execution Roadmap

ENTERPRISE OPERATING MODEL

Transformation approach used across four structured phases:

1

Discover

Identify KPI conflicts and ownership gaps

2

Pilot

Standardize revenue KPI

3

Expand

Apply model to additional KPIs

4

Institutionalize

Create enterprise operating model

Why This Matters

> Enterprise data transformation requires an operating model, not isolated projects.

Emilio Apestegui

Enterprise Analytics Outcome

DECISION-GRADE PERFORMANCE VIEW ENABLED

$253.2M

Actual Revenue

$231.6M

Plan Revenue

+8.9%

Variance Clarity

Confidence Indicators

- 191 validated records
- 1 open dependency

Business Value

- Faster executive decision cycles
- Reduced reporting disputes
- Trusted performance tracking

> Platform transformation converts data into a decision asset.

Emilio Apestegui

Enterprise Value Creation

MEASURABLE IMPACT

47	15	36hrs
Users Enabled	Manual Reports Eliminated	Per Week Saved

- Cost Reduction
- Speed to Insight
- Adoption Increase
- Risk Reduction

> Enterprise data leadership drives measurable business value.
